

ABSTRACT

The present invention relates to a method and
apparatus for treating of marine growth on the surface,
5 such as the holes of boats and ships.

A confinement arrangement is used to confine a volume
of heated fluid against the surface. The confinement
arrangement is retained against the surface by maintenance
and mounts rollers so that it can be moved over the
10 surface to treat other parts of the surface. A heated
fluid is provided to the confined volume from an external
heater.
